Musicarinic acetylcholine receptor M2, glandular - pig
NyAlternate names: muscarinic acetylcholine receptor III
C;Becies: Sus scrofa domestica (domestic pig)
C;Becies: 30-Sep-1989 #sequence_revision 30-Sep-1989 #text_change 18-Feb-2000
C;Accession: S0114
FBS Lett. 235, 257-261, 1988
A;Title: Primary structure of porcine muscarinic acetylcholine receptor III and antagonis A;Accession: S01114
A;Molecule type: DNA
A;Molecule type: DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A;Cross-references: EMBL:X12712; NID:g1861; PIDN:CAA31215.1; PID:g1862

-!- TISSUB SPECIFICITY: Expressed primarily in the bone marrow and eosinophils. Shows preferential distribution in cells of immunological relevance such as T-cells, dendritic cells, immunological relevance such as T-cells, dendritic cells, mast cells, neutrophils. Also expressed in a wide variety of peripheral issues, including the heart, kidney, liver, lung, pancreas, skeletal muscle, prostate, small intestine, spleen, fetal liver and lymph node. Pregulated or down-regulated upon activation of the lymphoid tissues and this regulation may depend on the presence of IL-10 or IL-13.

-!- INDUCTION: Expression is either up-regulated or down-regulated upon activation of the lymphoid tissues and this regulation may faceband on the presence of IL-10 or IL-13.

-!- MISCELLANBOUS: Does not bind diphenhydramine, loratadine, ranitidine, cimetidine, clobenpropit, thioperamide butimamide clozapine, immepip and imetit. The order of inhibitory activity was imetit - clobenpropit > burimamide > thioperamide burimamide closapine behaves as a partial agonist, dimeprim behaves as a full agonist. Thioperamide shows inverse agonism (enhances CAMP activity). The order of inhibitory activity while clozapine behaves as a partial agonism (enhances CAMP activity). The order of inhibitory activity while clozapine behaves was Histamine > N-alpha-methylhistamine > R(-)-alpha-methylhistamine > Both N-alpha-methylhistamine > R(-)-alpha-methylhistamine behave as full
                                                                                                                                                                                                                                                                                                                                                    Puhl H.L. III, Ikeda S.R., Aronstam R.S.; puhl H.L. III, Ikeda S.R., Aronstam R.S.; puhl H.L. III, Ikeda S.R., Aronstam R.S.; sequenced of human proteins involved in signal transduction sequenced by the Guthrie CDNA resource center (www.cdna.org)."; Submitted (UUL-2002) to the EMBL/GenBank/DDBJ databases.
-: FUNCTION: The H4 subclass of histamine receptors could mediate the histamine signals in peripheral tissues. Displays a significant level of constitutive activity (spontaneous activity in the

TESULE SPECIFICITY: Expressed predominantly in the CNS, with the greatest expression in the thalamus and caudate nucleus. The various isoforms are mainly coexpressed in brain, but their relative expression level varies in a region-specific manner. Isoforms 3 and 7 are highly expressed in the thalamus, caudate nucleus and cerebellum while isoforms 5 and 6 show a poor expection. Isoforms 5 and 6 show a high expression in the amygdala, substantia nigra, cerebral cortex and hypothalamus. Section 7 is not found in hypothalamus or substantia nigra. Independent of the syndrome is characterized by orthostatic hypothalamus. The found in hypothalamus or substantia nigra. Independent on bladder and bowel incontinence, anhidrosis, iris arrophy, amyotrophy, ataxia, rigidity and tremor. MISCELLANEOUS: Does not bind to cimetidine and tripolidine. Shows modest affinity for thioperamide, imetit, Nalpha-methylhistamine and R(-)-alpha-methylhistamine. Isoform 4 is unable to bind to iodoproxyfan while isoforms 1 and 3 bind it with high affinity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This SWISS-PROT entry is copyright.   FUNCTION: The H3 subclass of histamine receptors could mediate the
                   histamine signals in CNS and peripheral nervous system. Signals through the inhibition of adenylate cyclase and displays high constitutive activity (spontaneous activity in the absence of agonist). Agonist stimulation of isoform 3 niether modified adenylate cyclase activity nor induced intracellular calcium
                                                                                                                                                 SUBCELLULAR LOCATION: Integral membrane protein. ALTERNATIVE PRODUCTS:

Isold=09J315-1; Sequence=Displayed;
Name=Short; Synonyms=H3S;
Isold=09J155-2; Sequence=VSP_001880;
TISSUE SPECIFICITY: Expressed widely and abundantly throughout the brain. Highly expressed in discrete neuronal populations such as pyramidal cells in cerebral cortex or cerebellar Purkinje cells.
SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                             Cavia porcellus (Guinea pig).
Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,
Mammalia, Eutheria, Rodentia, Hystricognathi, Caviidae, Cavia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         EMBL; AF267537; AAF78947.1; -...

Submitted (JUL-2001) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: The H3 subclass of histamine receptors could mediate the histamine signals and peripheral nervous system. Signals through the inhibition of adenylate cyclase and displays high constitutive activity (spontaneous activity in the absence of agonist) (By similarity).
                                                                                                    VQPHGSLEQCWK -> CVERLGKLEASLLLPLWMFSGRWRR

Madata analysis of third cytoplasmic loop domains in G-protein coupling of the HMI muscarinic receptor.";
i-chem. Biophys. Res. Commun. 188:1111-1115(1992).
i-FUNCTION: The muscarinic acetylcholine receptor mediates various callular responses, including inhibition of ademylate cyclase, breakdown of phospholinositides and medulation of potassium channels through the action of G proteins. Primary transducing effect is PI turnover.
i-SUBCELLULAR LOCATION: Integral membrane protein.
i-SIMILARITY: Belongs to family 1 of G-protein coupled receptors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Arredondo J., Grando S.A.;
"Cloning cholinergic receptors in human keratinocytes.";
"Cloning cholinergic receptors in human keratinocytes.";
Submitted (MAY-2001) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: The muscarinic acetylcholine receptor mediates various cellular responses, including inhibition of adenylate cyclase, breakdown of phosphoinositides and modulation of potassium channels through the action of G proteins. Primary transducing effect is PI turnover.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SUBCELLULAR LOCATION: Integral membrane protein. SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Homo sapiens (Human).
